

— Matched Dr.GRPO
 — Normalized canonical Haarnoja

E46 normalized canonical Haarnoja vs matched Dr.GRPO — 0.5B

Only E46 and its retained matched Dr.GRPO comparator are shown. Countdown keys come from the exact AST that passes execution, target, and operand-use checks; graph keys come from the exact coloring vector that passes all constraints. The model never supplies its bank key. The comparator is matched by task, model, seed, data order, and budget, but was launched earlier. Mechanism panels are E46-only; the normalized-entropy target is 0.80 and alpha starts at 0.10. Mean support is cumulative verified outcomes divided by tracked prompts, and the strength ratio compares exploration RMS with ordinary task-advantage RMS. Thin lines are seeds; heavy lines require all three paired seeds 43/44/45. The retained Countdown seed-45 comparator and every E46 job use one node302 A100; the remaining comparator runs use A5000s.
