

d Dr.GRPO and preregistered evaluation. Every x-axis expands with the latest treatment checkpoint; panels in a row share that live frontier, while metric ranges tighten to the values observed so far. E56 uses K=8 exact-answer metrics with a 50-pass sentinel budget, but live-chart ingestion remains uncapped and will display later checkpoints. Gold-support-normalized coverage is deliberately omitted from this decision view and never enters the controller or terminal gate. Cancelled predecessor
Bank admission is validator-bound in every treatment: Countdown uses the executed exact AST, graph coloring the constraint-checked vector, and Python factors the externally executed return vector. The model cannot supply its own canonical key.
access-only open-set predictor gives negative pressure to repeated known outcomes and positive pressure to newly validator-confirmed outcomes; verified surprisal controls common-mass likelihood; and verified-bank entropy controls relative known-mode balance. All four coefficients use only their own 64-observation warmup/EMA state and remain unbounded. The two replay losses share one fixed 1/16 pseudo-rollout measure; training never reads gold support or evaluation. Solid lines
