

-- Matched Dr.GRPO
 — E45 MathIR fixed canonical MaxEnt
 — E46 normalized canonical Haarnoja

Current canonical experiments — E45 MathIR + E46 ModeBench — 0.5B

Each row uses its own matched Dr.GRPO and its preregistered evaluation: E46 uses K=8 exact-answer metrics; E45 uses K=16 executed MathIR and reports non-seed strategy discovery because its total support is unknown. Cancelled predecessor treatments are omitted. Bank admission is validator-bound in every treatment: Countdown uses the executed exact AST, graph coloring the constraint-checked vector, and MathIR the exact normalized state path produced by the successful interpreter. The model cannot supply its own canonical key. E46 adapts alpha toward normalized entropy 0.80; E45 fixes alpha=0.10. Thin lines are seeds; heavy means appear only once all paired seeds 43/44/45 have reached an evaluation boundary.
