

d Dr.GRPO and preregistered evaluation. Every x-axis expands with the latest treatment checkpoint; panels in a row share that live frontier, while metric ranges tighten to the values observed so far. E58 uses K=8 exact-answer metrics with a 50-pass sentinel budget, but live-chart ingestion remains uncapped and will display later checkpoints. Gold-support-normalized coverage is deliberately omitted from this decision view and never enters the controller or terminal gate. Cancelled predecessor
Bank admission is validator-bound in every treatment: Countdown uses the executed exact AST, graph coloring the constraint-checked vector, and Python factors the externally executed return vector. The model cannot supply its own canonical key.
or-positive bank per optimizer update in checkpointed prompt-hash round-robin order. Verified surprisal controls common mass, verified-bank entropy controls relative known-mode balance, and success-only open-set pressure explores newly verified outcomes. All three coefficients use only their own 64-observation warmup/EMA state and remain unbounded. The one-bank schedule is a fixed compute measure, not a desired entropy or mode count; training never reads gold support or eva
