

A STEP 1

Discover verified modes

one validator:
reward + identity

$y_1 \rightarrow c_1$ **seen**

$y_2 \rightarrow c_2$ **new +v**

$y_3 \rightarrow \perp$ **invalid**

a bonus needs
V to accept

B STEP 2

Retain every discovery

a new key joins
a lasting bank

$\{c_1\}$ **at start**

↓ + c_2

$\{c_1, c_2\}$ **kept**

**global replay,
round-robin**

it acts again
before its turn

C STEP 3

Preserve mass + rebalance

replay holds P^+ ,
evens the keys

before after

verified mass

known-key KL

high P^+ , no
key monopoly

D CONTROL

Self-referenced control

each sensor sets
one pressure

mode entropy ↓
→ β rare/new ↑

surprisal ↑
→ μ mass ↑

bank entropy ↓
→ α balance ↑

pressure tracks
its own sensor

E ESCAPE

Singleton escape

fires only when
one bank, one key

$\{c_1\}$ **alone**

↓ verify

+ c_2 **to bank**

replay support,
never enters PPO

one new key,
after warmup
