

— — Matched Dr.GRPO — Online growing-support canonical MaxEnt — Normalized-entropy Haarnoja control (E46)

E44-OGS + E46 normalized-entropy adaptive extension — 0.5B

Only E44-OGS and its prospective E46 adaptive extension are shown. Countdown keys come from the exact AST that passes execution, target, and operand-use checks; graph keys come from the exact coloring vector that passes all constraints. The model never supplies its bank key. E46 uses the frozen E44 arms as non-contemporaneous matched-seed comparators. Mechanism panels are treatment-only; the normalized-entropy target is 0.80 and fixed E44 alpha is 0.10. Mean support is cumulative verified outcomes divided by tracked prompts, and the strength ratio compares exploration RMS with ordinary task-advantage RMS. Thin lines are seeds; heavy lines require all three paired seeds 43/44/45. Pre-start placement amendment: the matched E44 Countdown seed-45 pair uses one node302 A100 per arm; E46 uses one node302 A100 per job; the remaining E44 runs retain A5000 placement.
