

E62 executable Python factors — same-seed safe-lookup mechanism pilot
status=pass; control step=384/384; E62 step=384/384; verified transform discoveries=793

—●— E60 mechanism control, seed 9011 —◆— E62-R10 prompt-local verified lookup, seed 9011

A model-generated verified output vector is serialized as a complete prompt-local conditional lookup and independently revalidated; training never sees gold support, a desired mode count, desired entropy, or evaluation feedback. Transform rows sent to PPO: exactly zero.
